

Soil Testing Orange

Preliminary Soil Assessment

The client had a request from Council for more information for a development application to be approved. A contamination soil testing was required as the farmland area to be built on possibly had chemical pesticides from drenching sheep.

CESsoils created a conceptual site model and assessed the soils through the steel corer samples collected from the sampling grid. They were tested, analysed and reported. It was discovered that there was no problem, and the report submitted to Council was accepted, and the development application approved.

The building is now underway.
