

Worm Casting Testing

Soil and Water testing

A client requested testing of their worm castings and the compost tea that they had made to determine the levels of phosphorus, potassium and nitrogen ratios. They required the testing, without analysis or reporting.

CESsoils sent the samples away for testing. Once it was returned, we informed the client of the ratios.

We also attended to answer any questions about why the ratios were what they are and fundamentally solved problems for the client. The client now has a clear grasp of the next steps in their business.
